Claims

Claim

... can use this coding in the manner he feels is most suitable.  
40)2.. Free Form Output Method, Enabling a Computer to Answer  
Questions about Recorded Text  
0 Data Class Format...but the different meaning for the other data  
Category is s9mi-invisible and hard to detect. A prime example of this  
phenomenon is that words with a meaning of Matter are...

...in reality two meanings for 'portable' as used in this example. There  
is:  
Matter & portable  
Location & portable  
Each meaning has its own Concept Hierarchy. Thus 'portable' has two  
meanings and  
two...

...by their names) have their own Concept Hierarchical  
structure, which is normally set by their locations :  
World & USA & New York State & New York City & Broadway & is 'St  
4th Floor & Suite 298...

...human handles location data is expressed in the Concept Hierarchy for a  
word with a location meaning. Because many words for things or  
locations actually have two meanings, one for thing...be related to the  
documents sent by Joe  
No Time is recorded for the now Location , so which location is old and  
which is new can not be found. In effect...or any of two or more words  
(in the same language) having the same general sense , but possessing  
each of them meanings which are not shared by the other or others...

INTL CLASS: H04N-001/387; G03G-021/00; G06T-001/00

ABSTRACT

PROBLEM TO BE SOLVED: To provide an image forming apparatus which prints original data, without printing visible an information matter on a paper and without being aware of a user.

SOLUTION: A driver 20 adds an electronic watermark on print image data and forms printed data from the print image data including the electronic watermark, a memory 10 stores the print data including the electronic watermark, and a printing processor 13 prints the data including the watermark. A manuscript reader 14 starts reading the manuscript. If a watermark reader 11 detects electronic watermark information, it sends the detected data to a controller 12 to read corresponding printed data from the memory 10, based on the detected data, and the processor 13 prints the read data.

JOURNAL: Section: P, Section No. 1768, Vol. 18, No. 370, Pg. 30, July 12, 1994 (19940712)

ABSTRACT

PURPOSE: To provide the OCR business form and its reader which are

excellent in a sense of beauty, and in which a substantially wide printing space can be provided.

CONSTITUTION: The OCR business form is provided with plural OCR boxes 5 which are arranged like a matrix at a prescribed interval and in which a pattern read by an OCR business from reader is entered, and transparent bar-codes 2, 3 and 4 which are formed in at least one edge part of this OCR box 5, and in which a pattern for showing position information or an attribute of a pattern entry column is formed in transparent ink. This OCR business form 1 can secure a substantially wide pattern entry column by providing the transparent bar-codes 2, 3 and 4 having no relation to entry of a pattern in an edge part of the OCR business form 1. Also, the transparent bar-codes 2, 3 and 4 are invisible to a user and excellent in a sense of beauty.

Multi-item input device has erase head to erase printed visible information on rewritable sheet, and print head to print newly input information on sheet while stopping sheet when printed position is located at input panel

Patent Assignee: OKI FIRMWARE SYSTEMS KK (OKIF-N)

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
JP 2005092351	A	9	G06F-003/023	

Abstract (Basic): JP 2005092351 A

NOVELTY - The erase and print heads (4,3) are arranged opposing a touch-sensitive information input panel (2). When a rewritable sheet (5) containing printed information is passed through the panel along direction (A), the erase head erases the visible information and a printing head prints the newly input information on the sheet. The movement of sheet is stopped when printed position is located at the panel.

USE - Multi-item input device using rewritable sheet for display of input information.

ADVANTAGE - Since printed information are erased and newly input information are printed on the sheet, automatically, the power for holding the display state is not required. Thus, the information can be viewed favorably from any angle.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic diagram of the multi-item input device. (Drawing includes non-English language text).

- touch-sensitive information input panel (2)
- print head (3)
- erase head (4)
- rewrite sheet (5)

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
AU 2003254722	A1	113	G06K-011/18	Div ex application AU 200047258

Abstract (Basic): AU 2003254722 A1

NOVELTY - A form containing graphic data (2) regarding purchase transaction and invisible coded data , is provided to the purchaser. The identity and reference point of the form is indicated in the coded data. When the sensor is placed in positional relationship with respect to the form, the coded data is sensed to generate the indicating data which is used to identify the purchasing transaction of the purchaser.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for the netpage printer system.

USE - For performing online purchase of goods using netpage printer system (claimed).

ADVANTAGE - Allows large number of purchasers to efficiently purchase goods at high speed.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of user interface flow for online purchasing.

Integrated color printer and binder for netpage publication e.g.  
traditional magazine, prints content of page descriptors in visible  
ink, and corresponding coded data in invisible ink, simultaneously  
onto media sheet

Patent Assignee: SILVERBROOK RES PTY LTD (SILV-N)

Abstract (Basic): US 20040046995 A1

NOVELTY - A wireless communicator receives set of page description corresponding to interactive publication, from a computer system. The color printer simultaneously prints content of page descriptors in visible ink, and corresponding coded data in invisible ink, onto the media sheet. The binder binds the printed media sheet together to form interactive publication.

USE - Integrated color printer and binder using thermal inkjet, piezoelectric inkjet or laser electrophotographic printer, connected to network for netpage publication e.g. traditional magazine, newspaper, catalogs, brochures and other publications.

ADVANTAGE - Ensures privacy and security of information printed on media sheet, by using invisible ink for coded data of page descriptor. Achieves high speed printing.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of the printed netpage and its online page description.

Abstract (Basic): EP 1281536 A2

NOVELTY - The magnetic printing media comprises a base layer (6), a magnetic layer (8) and an ink receptive layer (10), sequentially. The magnetic layer is adapted to record magnetically encoded information. The ink receptive layer is adapted to absorb ink.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a method of making a magnetically encoded printed document.

USE - For laser and inkjet printer and for verifying the authenticity of documents (claimed) for recording additional information that is not visible and protected from photocopying.

ADVANTAGE - The magnetic layer is able to record more information than the magnetic inks. The information recorded in the magnetic layer is not visible, so sensitive information is protected from viewing and photocopying. The images printed on the ink receptive layer are easily photocopied. Therefore sensitive material is magnetically encoded on the magnetic printing media allowing easy photocopying of the printed information. Different types of information, both printed text and magnetically encoded information are recorded.

DESCRIPTION OF DRAWING(S) - The figure shows a side view of the three layers of a magnetic printing media.

Base layer (6)

Magnetic layer (8)

Ink receptive layer (10)

Abstract (Basic): WO 200235449 A1

NOVELTY - The image data received from the camera system is transformed using an image processing program. The original image and transformed data are converted into an encoded fault tolerant digital form of image data and printed with invisible ink using an inkjet printing process on a print media surface, while simultaneously printing the original image data as a photographic image in a human readable form on the same surface.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for invisible ink encoded fault tolerant digital data printing apparatus.

USE - For printing large volumes of printed data in simple print media like card and in photograph.

ADVANTAGE - The data corruption errors while data scanning area avoided. Since the encoded tolerable digital form of the data is already available, there is not necessary for a negative. The need for two print heads is avoided as the same surface is used to record the data and the photograph.

DESCRIPTION OF DRAWING(S) - The figure shows the data surface of card or photograph.

IL 146646 A B41J-002/175 Based on patent WO 200071350

Abstract (Basic): WO 200071350 A1

**NOVELTY** - The ink cartridge has a housing defining several storage areas. One storage area contains colorant for printing **information** that is **visible** to the human eye. Another storage area contains colorant for printing **information** in a **form** that is **invisible** to the human eye, but readable by an optical reader.

**DETAILED DESCRIPTION** - Preferably the colorant for printing **information** in a **form** that is **invisible** to the human eye, is infrared ink. Also one of the storage areas is for black ink, and the cartridge also has storage areas for cyan, magenta and yellow ink. There may also be a storage area for ink fixative.

**USE** - For digital printer that prints information in a form that is readable by the human eye, and in a form that is invisible to the human eye, but readable by an optical reader.

**ADVANTAGE** - Provides for use when connected to the Internet, when a printed page needs to carry information in a form that can only be read by an optical reader linked to the network. If this were printed in a visible colorant, then it would probably obscure other text or images printed on the page.

**DESCRIPTION OF DRAWING(S)** - The figure shows an end sectional view of the cartridge.

Ink bladders (631 to 635)

Fixative bladder (644)

Access request registration for netpage networked computer system,  
involves receiving identity data from sensing device to indicate  
identity of sensing device and form filled by user

Based on patent WO 200103017

Abstract (Basic): WO 200103017 A1

NOVELTY - A computer system receives identity data from the sensing device, which indicates the identity of sensing device and the form and text or mark recorded on the form by the sensing device. The indicating data and stored user registration data are matched and identity of registered user is determined. The registration data associated with identity of registered user is stored in computer system.

DETAILED DESCRIPTION - A printed registration form with registration information and coded data having identity of form and reference data of form is filled by user of terminal. An INDEPENDENT CLAIM is also included for user access request registration system.

USE - For acquiring access right for accessing terminal of netpage network computer system.

ADVANTAGE - The netpage system uses invisible coded data in the form which ensures high level security.

DESCRIPTION OF DRAWING(S) - The figure shows the schematic view of user authorization user interface flow.

Abstract (Basic): WO 200072132 A1

NOVELTY - When a **sensing** device is placed in near interface surface containing textual information and invisible coded data , the identification data corresponding to document is detected using coded data to forward the document either to a **printer** or to a monitor to **print** or display the document.

USE - For e.g. document in surface base interface.

ADVANTAGE - Enables to obtain interactive printed matter on demand through high speed networked color **printers** .

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart for input process algorithm.

Abstract (Basic): WO 200072126 A1

NOVELTY - A printer (601) has a coded data generator for generating a coded data based partially on an identity data in a document data which is received from a computer system. A printhead in the printer prints an interface which has visible information in addition to the coded data onto a surface.

USE - For use with netpage networked computer system.

ADVANTAGE - Easier interaction of users with the networked information is achieved by generation of a code data and printing an interface which has visible information in addition to the coded data onto a surface. Coded data is not visible to average unaided human eye under day light or ambient lighting conditions. Coded data is also used to indicate a reference point of particular region on interface.

DESCRIPTION OF DRAWING(S) - The figure shows perspective view of a wall mounted netpage printer.

Printer (601)

Abstract (Basic): WO 200007356 A2

NOVELTY - The security document includes a substrate and visible weave-like tiled calibration pattern. The calibration pattern has Fourier-Mellin transform facilitating decoding of digital watermark from scan data. The pattern extends across the document and the pattern and watermark are realized by texturing the document and not by printing.

DETAILED DESCRIPTION - Each 250 micron by 250 micron zone of calibration pattern in the security document has 8 bit grey scale value within 25% of the value of all the zones of the pattern. INDEPENDENT CLAIMS are also included for the following:

- (a) method of producing security document;
- (b) apparatus for use with security document

USE - Security documents such as bank notes, traveler checks, bearer bonds, passports, visa, other immigration documents, stock certificate, postal stamps, lottery tickets, sports/concert tickets etc., have binary data embedded in it for discouraging counterfeiting of security documents. Also used in transferring machine readable information through the documents without alerting human viewers.

ADVANTAGE - The calibration mark in the security document facilitates detection of encoded information notwithstanding possible scaling or rotation of scan data. In passport processing station, responsive to digital watermarking, decoder binary data is used to access database having information concerning passport holder.

DESCRIPTION OF DRAWING(S) - The figure shows virtual array of grid points imposed on security document image.

US 5812705 A 27 G06K-009/32 Cont of application US 95395948

Abstract (Basic): US 5812705 A

The device has a four channel sensor to detect energy reflected from a paper web in the visible and the infrared regions. The system has a colour video camera or sensor with three channels to detect ink attributes from a printed sheet in the visible region. The sensed information is sent to a computer with display for storage and processing.

A black/white second video camera with filter, senses ink attributes in the infrared region of wave length greater than the visible light wave length. It transmits the sensed information from the sheet to be processed by the computer. The computer compares the two images to detect variation of ink distribution for the colour and black inks. The differences are used to provide ink adjustment for the press control.

USE - For adjustment of ink input rate in lithographic/letterpress, ink consistency in flexographic or gravure press, water input rate in lithographic press, temperature.

ADVANTAGE - Exact alignment.

DE 19612406 A1 7 G06K-019/08

DE 19612406 C2 G06K-019/08

Abstract (Basic): DE 19612406 A

Information is presented in basic form as printed letters (1). In parallel with this is a bar code (1) that is not normally visible . The bar code is read with the aid of an optical probe (2) that has

an emitter (4) that outputs modulated light in the ultraviolet spectrum. This activates a fluorescent component in the printed bar code and light is reflected back to be received by a light sensor (7).

USE/ADVANTAGE - Information coding of products. Allows bar code to be superimposed on printed information.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 5502304	A	10	G06K-007/12	

Abstract (Basic): US 5502304 A

The system includes a device for reading a first indicia that is printed on an object with a ink that is visible to the human eye by reflected light. A device is provided for reading a second indicia that is placed on top of the first indicia. The second indicia is similar in appearance to the first indicia but differs from the first indicia and the second indicia is made of a luminescent ink that is invisible to the human eye.

The system also incorporates a device for switching from the first reading device to the second reading device so that the first and second indicia or a portion of the first and second indicia appear to a human observer viewing the first and second indicia to move. The first reading device includes a first light source that emits incident light that is reflected from the first indicia; and a first detector that reads the reflected light.

USE/ADVANTAGE - As bar code reader reading luminescent invisible ink. Hard to make forgery copy, for preventing unauthorised use of documents to which bar codes have been affixed.

Abstract (Basic): WO 9417623 A

The discriminator includes a detector for sensing an invisible image which is formed from a colourless invisible coating. The detector senses image data and uses it to determine if the original is special or not.

The image reader having the special original detector pref. senses infrared or ultraviolet images using a CCD image sensor . A

switching filter may be used in order to detect and read red, green and blue separately.

USE/ADVANTAGE - For colour copier or printer . Differentiates between copy of paper money and actual paper money, valuable papers etc., and prohibits copying.

EP 585000 A3 H04N-001/00

Abstract (Basic): EP 585000 A

The sheet processor includes a recording sheet for printed information. A memory (1) stores print data corresp. to the print information. An editing unit (5) inputs editing data, and part of the print data is edited when the editing data is input to an editing display (6). A support holds a recording sheet such that the print information is visible in a window (4).

The editing display is associated with the window. It displays the editing data at a selected part of the window corresp. to a part of the print information. The editing display is a liquid crystal display,

or a CRT display. The editing display is located below the support. One recording sheet is translucent or transparent.

ADVANTAGE - Alternative to wordprocessor and printer. Avoids need to re-enter editing data. Can detect if sheet is stained. Quick input of editing data.

Abstract (Basic): EP 506479 A

The appts. has a main CPU (100) for overall control, connected to **printer** and reader CPUs (102,104), a main image processor (106) for displaying an image, a user input port (108), a banknote paper **detector** (120) and an image pattern generator (122). In operation, a signal denoting the manufacturer's serial number is generated in the pattern generator in response to a signal **detected** by the banknote **detector**.

The serial number signal and the binary coded image signal are synthesised (124) with the result that the appts. used to copy banknote paper can be **detected** from the image of the specific original document, e.g. banknote paper.

USE/ADVANTAGE - Esp. in reproduction of multi-colour documents.  
Restrains operators from copying specific original documents.

Priority Applications (No Type Date): DE 2545799 A 19751013

Abstract (Basic): DE 2545799 A

An identify or credit card contains a thin film containing identification details in a form invisible to the naked eye. These details are only visible when located in an optical reading device. The multi-layer constructed card has two transparent layers (1, 2) that

sandwich a sheet (3) containing printed data that is visible to the naked eye. This data is typically the name of the holder and the name of the banking institution.

A top foil (4) is bonded onto the transparent layer and contains the signature of the holder. An intermediate layer (6) of a photographic sensitive material e.g. silver halogenide, contains the holders name etc, in holographic form that is only visible when inserted in a reader and subjected to suitable light source.

Title Terms: CREDIT; CARD; DATA; INVISIBLE; NAKED; EYE; MULTILAYER; CARD; HOLOGRAM; DATA; VISIBLE; PLACE; OPTICAL; READ

Priority Applications (No Type Date): US 73329385 A 19730205

Abstract (Basic): US 3927302 A

Information in the form of visible alpha-numeric characters, representing the day and time is printed on the card by a print mechanism actuated on insertion of the card into the time recorder. The time recorder is provided with sensing means which, simultaneously with the actuation of the print mechanism, senses pre-recorded data in a selected region of the card and causes an electrical signal representing the pre-recorded data to be fed to a data storing bank together with signals representing the information being applied to the card. The sensing means operates by sensing light which passes through holes punched in the card.
